

Patient: **SAMPLE
PATIENT**

DOB:

Sex:

MRN:

Calprotectin		
Analyte	Result	Reference Range
Calprotectin		<=50 mcg/g

If the patient's result is less than the functional sensitivity (FS) of the assay, then the FS is used for calculation purposes.

Commentary is provided to the practitioner for educational purposes, and should not be interpreted as diagnostic or as treatment recommendations. Diagnosis and treatment decisions are the practitioner's responsibility.

Calprotectin:

Calprotectin is a neutrophilic marker specific for inflammation in the gastrointestinal tract. It may be elevated with IBD, infection, neoplasia and use of nonsteroidal anti-inflammatory drugs (NSAIDs). Fecal calprotectin is FDA-cleared to differentiate between IBD and IBS.

- Levels <= 50 mcg/g are considered normal.
- Levels between 50-120 mcg/g are considered borderline and should be re-evaluated at 4-6 weeks.
- Levels > 120 mcg/g are considered abnormal, the source of inflammation should be determined, and levels repeated as clinically indicated.
- Levels > 250 mcg/g have been associated with high risk of clinical relapse in patients with IBD.
